

TESTING 3 TYPES 3.1

TEAM GROUP 3 • SNHS LABORATORY DEPARTMENT

INTRODUCTION

Laboratory tools are essential in conducting scientific experiments safely and accurately. Each tool has a specific purpose that helps scientists observe, measure, or handle materials properly. This activity **aims to familiarize students with common laboratory tools and their basic functions.**

METHODOLOGY

Several common laboratory tools were observed. Each tool was identified by name, and its primary use in the laboratory was noted based on prior knowledge and observation.

DATA & RESULTS

The laboratory tools identified included a beaker, test tube, graduated cylinder, thermometer, and microscope. The beaker was identified as a container used for holding and mixing liquids. The test tube was recognized as a tool for holding small amounts of substances. The graduated cylinder was identified as a tool used for measuring liquid volume accurately. The thermometer was identified as a device used to measure temperature while the microscope was identified as an instrument used to observe small objects not visible to the naked eye.

CONCLUSION

WARNING: UNDEFINED C:\XAMPP\HTDOCS\SNHS- (ARRAY KEY INVENTORY\PAGES\STUDENT\PREVIEW_COMPILER.PHP) "STATUS" IN

The activity successfully demonstrated the importance of correctly identifying laboratory tools and understanding their functions. Proper knowledge of these tools helps ensure accuracy and safety during laboratory work and prepares students for more advanced scientific experiments.
